REC\_DS using C\_Week 7\_COD\_Question 3

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

## **Input Format**

The first line consists of an integer n, representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string k, representing the contact to be checked or removed.

## **Output Format**

If the given contact exists in the dictionary:

- 1. The first line prints "The given key is removed!" after removing it.
- 2. The next n 1 lines print the updated contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

If the given contact does not exist in the dictionary:

- 1. The first line prints "The given key is not found!".
- 2. The next n lines print the original contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

Refer to the sample outputs for the formatting specifications.

## Sample Test Case

Input: 3 Alice 1234567890 Bob 9876543210 Charlie 4567890123 Bob

> Output: The given key is removed! Key: Alice; Value: 1234567890 Key: Charlie; Value: 4567890123

#### Answer

#include <stdio.h> #include <string.h> #define MAX 50

typedef struct { char key[11];

```
char value[15];
     int occupied;
HashEntry;
    int hashFunc(const char *key, int size) {
      int sum = 0;
      for (int i = 0; key[i] != '\0'; i++) {
         sum += key[i];
      }
      return sum % size;
    }
    void insert(HashEntry table[], int size, const char *key, const char *value) {
      int idx = hashFunc(key, size);
   while (table[idx].occupied == 1) {
         if (strcmp(table[idx].key, key) == 0) {
           strcpy(table[idx].value, value);
           return;
         idx = (idx + 1) \% size;
      strcpy(table[idx].key, key);
      strcpy(table[idx].value, value);
      table[idx].occupied = 1;
    }
                                                                                    241801241
    int search(HashEntry table[], int size, const char *key) {
    int idx = hashFunc(key, size);
      int start = idx;
      while (table[idx].occupied != 0) {
         if (table[idx].occupied == 1 && strcmp(table[idx].key, key) == 0) {
           return idx;
         idx = (idx + 1) \% size;
         if (idx == start)
           break:
      }
      return -1;
    int main() {
      int n;
```

```
241801241
HashEntry table[MAX];
for (int i = 0; i < M^^``
       for (int i = 0; i < MAX; i++) {
          table[i].occupied = 0;
       char keys[MAX][11];
       char values[MAX][15];
       for (int i = 0; i < n; i++) {
          scanf("%s %s", keys[i], values[i]);
          insert(table, MAX, keys[i], values[i]);
       }
       char k[11];
       scanf("%s", k);
                                                            241801241
if (pos!= -1) {
tableInc.
       int pos = search(table, MAX, k);
          table[pos].occupied = 0;
          printf("The given key is removed!\n");
          for (int i = 0; i < n; i++) {
            if (strcmp(keys[i], k) != 0) {
               printf("Key: %s; Value: %s\n", keys[i], values[i]);
            }
          }
       } else {
          printf("The given key is not found!\n");
          for (int i = 0; i < n; i++) {
            printf("Key: %s; Value: %s\n", keys[i], values[i]);
       return 0;
```
